

Avfurnishings:

for wood door hinge installation and adjustment

Required Tools:

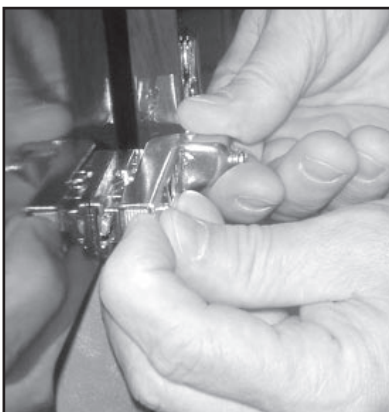

1- Philips screw driver

1. Mount the hinges on the doors by inserting them into the mounting holes and securing them with 2 - #6 x 5/8" screws provide. The door is ready to be installed on the cabinet. The hinge clips onto the mounting plate by first hooking the front of the hinge arm onto the plate.

The hinge clips onto the mounting plate by first hooking the front of the hinge arm onto the plate.

2. Push the back of the hinge arm towards the mounting plate until you here it click into place.

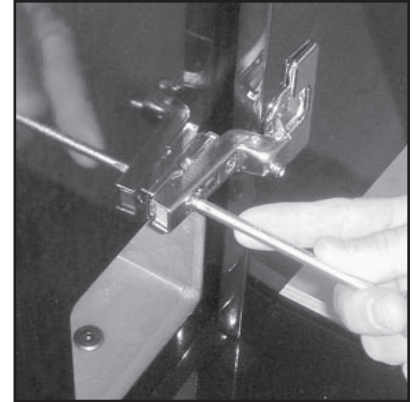

3. You may remove the hinge from the mounting plate by pulling the tab at the back of the hinge arm and pulling it away from the mounting plate.

Quick Tip: At this point it is recommended that the knob or pull be installed on the door. This will make it easier to open and close the door during the adjustment step.

Hinge Adjustments:

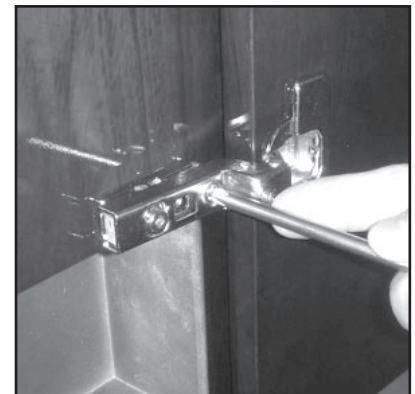

There are three screws on the hinge arm and one screw on the mounting plate that adjust all aspects of the hinge. The hinges are set at the factory but they may need minor adjustment on site. You will only need a Philips screw driver to do the adjustments.

The first screw at the end of the arm will **4.** adjust the position of the door from front to back. Use this adjustment if the doors are not quite lined up with each other when the doors are closed.

5. The second screw, which actually adjusts the mounting plate, is used to move the door vertically. If this adjustment is necessary both upper and lower hinge mounting plates must be moved the same amount. If one plate adjusted and the other is not binding may occur thereby shortening the life of the hinges and affecting the movement of the door.

That's it, your done. Now you can start **8.** setting the shelf heights to where you want them and begin to put all your components in place. Use the wire anchors on the back of the shelves to securely hold all the wires in place nice and neat.
